Business Requirements Document

Project: E-Commerce One-Click Checkout & Wallet
Company: Lumenfield Home Goods Ltd (fictional)
Version: 0.9 (draft for architecture review)

SYNTHETIC DOCUMENT — created for a hackathon demo. All names, figures and systems are fictional.

1. Introduction

1.1 Purpose

This document describes the business requirements for a faster checkout experience and a stored-value wallet on the Lumenfield online store. It is intended for product, engineering and architecture teams who will estimate and design the solution.

1.2 Background

Lumenfield sells furniture, lighting and home accessories online in the UK and EU. Today, customers must re-enter delivery and card details on every order. Analytics show that 68% of mobile sessions that reach the payment page do not complete the purchase. Customer interviews highlight the length of the checkout form and the lack of a quick way to pay as the main frustrations.

1.3 Scope

In scope: one-click checkout for signed-in customers, saved payment cards, a Lumenfield Wallet that customers can top up and spend, order confirmation notifications, and an operations view of wallet transactions. The marketplace for third-party sellers and in-store payments are not part of this release.

1.4 Stakeholders

Role	Interest
Head of Digital Commerce (sponsor)	Conversion rate and revenue growth
Customer Operations	Handling wallet queries and order issues
Finance	Wallet balances and payment settlement
Information Security	Protection of customer and payment data
Customers	Fast, trustworthy checkout

2. Business Goals

2.1 Increase conversion

Raise mobile checkout conversion from 32% to 45% within six months of launch.

2.2 Grow repeat purchases

Increase the share of orders from returning customers from 28% to 40% by making repeat purchases effortless.

2.3 Introduce a wallet

Launch the Lumenfield Wallet so that customers can hold a balance (top-ups, promotional credit and gift card redemptions) and spend it at checkout, alone or combined with a card.

3. Functional Requirements

3.1 One-click checkout

FR-1. A signed-in customer with a default delivery address and a default payment method shall see a "Buy now" button on product pages and in the basket.

FR-2. Selecting "Buy now" shall place the order immediately using the default address, default delivery option and default payment method, and show the order confirmation page.

FR-3. The customer shall be able to change the default address, delivery option and payment method from their account page.

FR-4. One-click checkout shall be available on web (desktop and mobile browsers).

3.2 Saved payment cards

FR-5. During a normal checkout the customer can tick "Remember this card for faster checkout".

FR-6. Saved cards shall be shown with card brand, last four digits and expiry date. Customers can add, remove and choose a default card.

FR-7. Payments shall be authorised and captured through the payment gateway, PayBridge (fictional), which also performs Strong Customer Authentication when the card issuer requires it.

3.3 Lumenfield Wallet

FR-8. Each customer account has one wallet with a balance in GBP or EUR, depending on the store region.

FR-9. Customers can top up the wallet by card in amounts between 10 and 500 per top-up.

FR-10. At checkout, the customer can pay fully from the wallet, or use the wallet balance first and pay the remainder by card (split payment).

FR-11. Promotional credit from marketing campaigns and gift card codes can be added to the wallet.

FR-12. The customer can view wallet history: top-ups, payments, promotional credit and gift card redemptions.

3.4 Notifications

FR-13. The customer receives an order confirmation e-mail and, where opted in, an SMS.

FR-14. The customer receives an e-mail whenever the wallet is topped up or used.

3.5 Operations

FR-15. Customer Operations staff can search wallets by customer e-mail and view the transaction history.

FR-16. Finance receives a daily report of total wallet balances, top-ups and wallet spend.

4. Non-Functional Requirements

4.1 Performance

NFR-1. The order confirmation page shall appear within 2 seconds for 95% of one-click orders.

NFR-2. The platform shall support 300 orders per minute during seasonal sales events.

4.2 Availability

NFR-3. Checkout and wallet services shall be available 99.9% of the time, measured monthly.

4.3 Security

NFR-4. Customers must be signed in to use one-click checkout or the wallet.

NFR-5. Staff access to the operations view shall require single sign-on with the company identity provider.

4.4 Usability and accessibility

NFR-6. Checkout pages shall meet WCAG 2.1 AA.

5. Data Requirements

DR-1. The system stores customer profile data: name, e-mail, phone number, delivery addresses and order history.

DR-2. The system stores saved payment card details so that one-click checkout does not require the customer to re-enter them.

DR-3. The system stores the wallet balance and every wallet transaction.

6. Integrations

INT-1. PayBridge payment gateway (fictional) for card authorisation, capture and Strong Customer Authentication.

INT-2. Existing Order Management System for order fulfilment.

INT-3. Existing e-mail and SMS notification service.

INT-4. Finance reporting data warehouse (daily batch).

7. Assumptions and Constraints

A-1. Customers already have accounts; registration and sign-in are unchanged.

A-2. Delivery options and prices are provided by the existing Order Management System.

C-1. The solution must use the company's approved technology stack.

C-2. Target launch is before the autumn sales season.

8. Success Metrics

Metric	Baseline	Target
Mobile checkout conversion	32%	45%
Orders from returning customers	28%	40%
Customers with a funded wallet	0%	15%
Average checkout time (returning customer)	95 s	under 10 s
